Synthetic layout examples: PRL with selected headings

Typography demonstration only

These synthetic layout examples contain no research findings. They illustrate chosen headings, not a required paper structure. This is a REVTeX preview, not a published paper or publisher-identical facsimile.

Introduction—The title and em dash are italic, without a full stop before the dash. Upright body text follows on the same line. The first line is indented. The name and presence of this heading are optional.

Illustrative model—A descriptive main-text heading follows the same typography. Actual manuscripts determine the number and names of their sections from their scientific argument.

Global fit: This optional secondary heading is roman. A colon and an em space separate it from the body text.

Boundary conditions. A further subtopic uses an italic heading, a period, an ordinary word space, and then upright body text. It does not use the main-heading em dash.

Conclusions—This example chooses a plural ending. A paper could use Conclusion, Outlook, another descriptive title, or no closing heading.

Note added.—This typography-only sentence shows the specific period-plus-dash exception. It does not announce newly discovered research.

Acknowledgments—This is an illustrative placeholder. No contributor or funding source is being asserted. The native PRL environment has no printed title, so the explicit helper supplies one.

Data availability—This is an illustrative placeholder, not a factual data-availability statement. Authors must describe their real data.

Synthetic layout examples: PRL with an unheaded opening

Typography demonstration only

This synthetic opening is intentionally unheaded. It demonstrates that selecting PRL typography does not require an Introduction label. The paragraph reports no scientific result and is not a reproduction of a published article.

The paper may continue naturally for as many paragraphs as the actual argument requires. Nothing in the heading helpers inserts a missing section or dictates an IMRaD outline.

Illustrative setup—Only an author-selected descriptive heading is printed here. It is italic, indented, unnumbered, and followed by an italic em dash without a preceding period.

Outlook—This optional closing heading replaces a Conclusion label in this example. The body text resumes upright on the same baseline. The wording remains an editorial choice for the actual manuscript.

Acknowledgments—Illustrative placeholder only. No real contribution or support is asserted.

Data availability—Illustrative placeholder only. A real manuscript needs a truthful statement based on its actual research.

Synthetic layout examples: PRL without main-text headings

Typography demonstration only

This synthetic opening paragraph has no heading. It contains no scientific result and is not a published paper. The example exists only to confirm that the typography workflow leaves unheaded prose unheaded.

A short argument may proceed directly through connected paragraphs. Formatting assistance should preserve the author's chosen structure rather than insert Introduction, Model, Results, or Discussion labels automatically.

This synthetic final main-text paragraph also has no heading. No Conclusion or Outlook title is required by the helper. The absence of headings is a structural choice; when the author does use a heading, the chosen journal's typography then governs its appearance.

Acknowledgments—Illustrative placeholder only; no contributor or funding source is asserted.

Data availability—Illustrative placeholder only; not a claim about any actual dataset.

Synthetic layout examples: Regular Article heading preview

Typography demonstration only

This synthetic example uses the PRA class option. A checked, opt-in font hook makes the third level bold italic as described in the 2026 APS guide. Other native section behavior is preserved. This is a local typography preview, not a publisher-identical facsimile.

I. ILLUSTRATIVE PRINCIPAL HEADING

This native principal heading is standalone, centered, bold, uppercase, and numbered with a roman numeral. The content and wording are merely illustrative.

A. Illustrative first subheading

This native subheading is standalone, centered, bold, and preceded by a capital letter.

1. Illustrative second subheading

This third level is standalone, centered, bold italic, and preceded by an arabic numeral. Only its dedicated font hooks are changed. Native REVTeX4.2f is italic but not bold at this level.

II. ANOTHER AUTHOR-SELECTED SECTION

Sections need not follow a fixed Introduction, Methods, Results, Conclusion scheme. A manuscript may use descriptive headings or omit subdivisions it does not need.

ACKNOWLEDGMENTS

This illustrative acknowledgment appears under a standalone, unnumbered principal-style heading. No real support or contribution is being asserted.

DATA AVAILABILITY

This illustrative placeholder demonstrates the unnumbered principal heading. It is not an actual data-availability statement.

Synthetic layout examples: a non-PRL Letter

Typography demonstration only

This synthetic example uses the PRA class option with explicitly selected Letter heading typography. The same helper was compiled with PRB, Physical Review Applied, and the generic physrev fallback for Physical Review Research. REVTeX4.2f has no letter option that activates this style.

Introduction. This optional heading is indented, unnumbered, and italic. A period and an ordinary word space precede the upright body text. There is no em dash.

Illustrative model. The paper chooses its own descriptive headings. These examples do not claim a research result or require this section to exist.

Global fit: An optional further level uses a roman heading, a colon, and an em space, with text on the same line.

Outlook. A closing title can be chosen to fit the actual argument or omitted. Its wording is not fixed by this formatting example.

Acknowledgments. This illustrative placeholder follows the non-PRL Letter run-in style. It is not a claim of support from any person or organization.

Data availability. This illustrative placeholder follows the run-in presentation observed in 2026 PRA and Physical Review Research Letters. The guide's general data-statement wording differs; the accompanying report records that distinction.

Appendix: Illustrative derivation. This optional appendix title follows the same current Letter examples. Its content is a typography placeholder, not a scientific derivation. An appendix is not automatically added to a manuscript.
